

How does COMMUNITY SOLAR work?

1. Sunlight hits the solar panels in the community solar field, generating electricity.
2. The electricity generated flows through an on-site meter to the electrical utility grid.
3. The utility company measures the electricity generated, calculates a dollar value for the power, and distributes this dollar value proportionally to the members of the community solar program (residents, businesses, municipalities, and institutions).
4. The value of the solar electricity produced from the array is applied as a monetary credit to each member's electric bill.

**The community solar fields that we have partnered with
are currently guaranteeing a 10% savings.**
